Plasma Spray – Physical Vapor Deposition (PS-PVD)

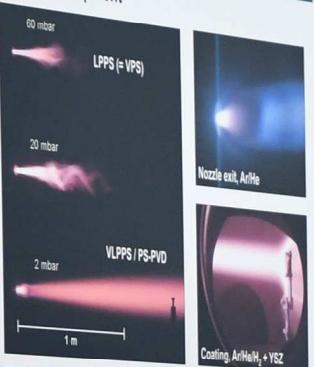

The manufacture of EB-PVD-like columnar structured, strain-tolerant thermal barrier coatings (TBCs) by plasma spraying was the major motivation to develop the plasma spray-physical vapor deposition (PS-PVD). Besides, also thin and gas tight layers can be obtained by PS-PVD even directly on highly porous substrates. Typical applications are gas separation membranes and electrolytes for solid oxide fuel cells.

Process development

Metallic alloys are deposited by plasma spraying under protective argon atmosphere and low pressure (< 10 kPa) (low pressure plasma spraying, LPPS, also termed vacuum plasma spraying, VPS).

Several years ago, the pressure was decreased (< 500 Pa) to obtain particular thin and dense coatings. This process is termed very low plasma spraying (VLPPS).

Increasing electrical currents up to 3 kA, so that an input power of 150 kW and more is achieved, it is even possible to evaporate ceramic feedstock. This process is termed plasma spray-physical vapor deposition (PS-PVD).

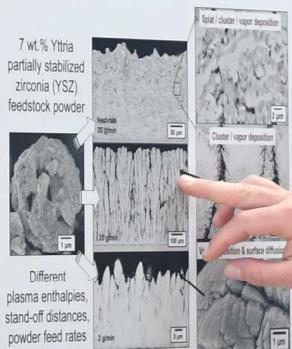

TBC microstructures

Computational fluid dynamic simulations for a typical PS-PVD process to deposit columnar YSZ revealed that 64% of the plasma net power was absorbed by the feedstock particles and 57% of the feedstock mass is transferred to vapor.

Evaporated feedstock atoms and molecules follow the plasma gas streamlines. In the boundary layer of the substrate, super-saturation is likely so that stable clusters can be formed.

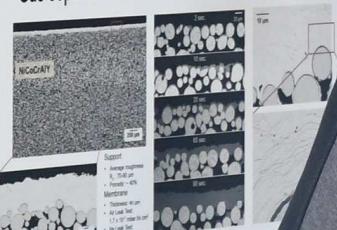

As molecules and clusters are diverted parallel to the substrate surface, columns are generated by shadowing due to the interaction between surface roughness and angular directions of arriving particles.

Gas separation membranes

PS-PVD allows for lower deposition temperatures (800–1000°C) in much shorter times than conventionally applied in other ceramic processing routes. After impact, the splats remain highly flowable and form thin and dense lamellae.

Example:
Mixed ion and electron conductor
 $\text{La}_{0.58}\text{Sr}_{0.4}\text{Co}_{0.2}\text{Fe}_{0.8}\text{O}_3$ (LSCF)

ROOM 338

EDUCATIONAL COURSE

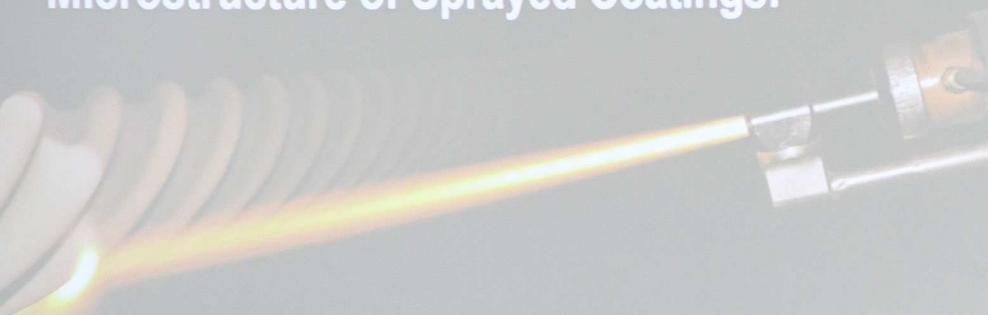

Thermal spray technology: Position among Films and Coatings, Characterization and Application, and Technology

09:00	Welcome and introduction Lech Pawłowski and Georg Mauer
09:15	Physical Methods of Film and Coatings Deposition Lech Pawłowski
10:15	Microstructure Control of Sprayed Coatings: Particularities, Usefulness From Splat to Coatings Thomas Grund, Chang-Jiu Li
11:15	Coffee break
11:30	Evolution of Thermal Spray Technology and its Applications Shrikant Joshi
12:30	Lunch break (Seecasino)
13:45	Thermal Spray Process Diagnostics and Deposit Formation Dynamics Sanjay Sampath
14:45	Experimental demonstration of films and coatings technologies as well as their applications Georg Mauer and colleagues
16:00	ETSA GENERAL ASSEMBLY 5 th General Assembly of the European Thermal Spray Association
19:00	WELCOME RECEPTION: FOOD AND DRINKS

Microstructure of Sprayed Coatings:

Particularities, Usefulness, and Methods of Characterization

-
From splat to coatings
